

ABSTRACT

A method of training a biological neural network using a controller, comprising:

applying a cycle comprising:

- stimulating a neural network by said controller applying at least an input signal
- 5 to the network;
- detecting an output response of the network by said controller; and
- modifying said stimulation by said controller for at least a period of time if said
- response matches a desired at least approximate response; and
- repeating said cycle of stimulation, detection and modification at least one more time
- 10 until said neural network is trained to generate a desired output response for said input signal.
